ABSTRACT	1
1. INTRODUCTION	1
1.1 Background	1
1.2 Purpose of this Report	2
2. INTERFERENCE INJECTION METHODOLOGY	3
2.1 Radiated Versus Hardline-Coupled Interference	3
2.2 Earth Station Receiver Description	3
2.3 Interference Signals	7
2.4 Interference Criteria and Data Collection	8
3. INTERFERENCE INJECTION RESULTS	10
3.1 Interference Data Curves	10
3.2 Interpretation of Results: Constant PRR Interference	11
3.3 Interpretation of Results: Jittered-Pulse Interference	16
3.4 Determining Electromagnetic Compatibility for Earth Station Installations	17
4. CONCLUSIONS AND RECOMMENDATIONS	18
4.1 Conclusions Regarding Pulsed Interference into Digital Earth Station Receivers	19
4.2 Recommendations	20
5. REFERENCES	20

FIGURES

Figure 1. Earth station 3.3-m diameter reflector with RF feed and interference coupler	5
Figure 2. Earth station RF feed and interference coupler (detail view)	5
Figure 3. Digital Earth station test and measurement block diagram	6
Figure 4. Measured spectrum of desired digital signal in 1-MHz IF bandwidth	6
Figure 5. Earth station internal noise (peak and RMS) measured in 1-MHz bandwidth at LNB output.	7
Figure 6. Interference generator block diagram.....	9
Figure 7. Tiling effect of interference, 1 dB below loss of frame	9
Figure 8. Interference thresholds as a normalized function of pulse repetition interval	12
Figure 9. Interference thresholds as a function of pulse repetition frequency.....	12
Figure 10. Interference thresholds as a function of duty cycle	13
Figure 11. Interference thresholds as a function of pulse repetition rate and duty cycle	13
Figure 12. Interference thresholds as a function of interference pulse width and prr	14
Figure 13. Short-pulse interference thresholds as a function of duty cycle and prr	14
Figure 14. Short-pulse interference thresholds as a function of pulse repetition frequency .	15
